

How can I achieve this with MinGW on Ubuntu since I can't find any relevant documentation on the internet for building MySQLCPPCONN specifically for cross compiling?

But i still not understand the benefits of using it. Is it for unsubscribe from the observable when destroying the view so it will go from onNext() to onComplete() and close the subscription on the emitter?

So I wrote and tried a very simple program and GUI. The code is below. What I found was that if I set the items in the TableView to null, cleared out the ArrayList, and instantiated a new ArrayList of the same variable name, only then it would GC. Is this normal behavior for Java and/or JavaFX? Normal in that it won't "destroy" those objects in a tab once the tab is closed? Bug with Java 8/FX?

It took the development of rockets and airplanes on Earth to get to near vacuum atmosphere. People on this planet can walk there. Starting from a early 1920's technology level would their development of technology for living in a vacuum be accelerated by their ability to simply walk into one?
